

NeuroForge: Experimental Scope at a Glance

RTX 4070 Ti · 3 seeds throughout · 800 train / 200 val cases (AirFlow)

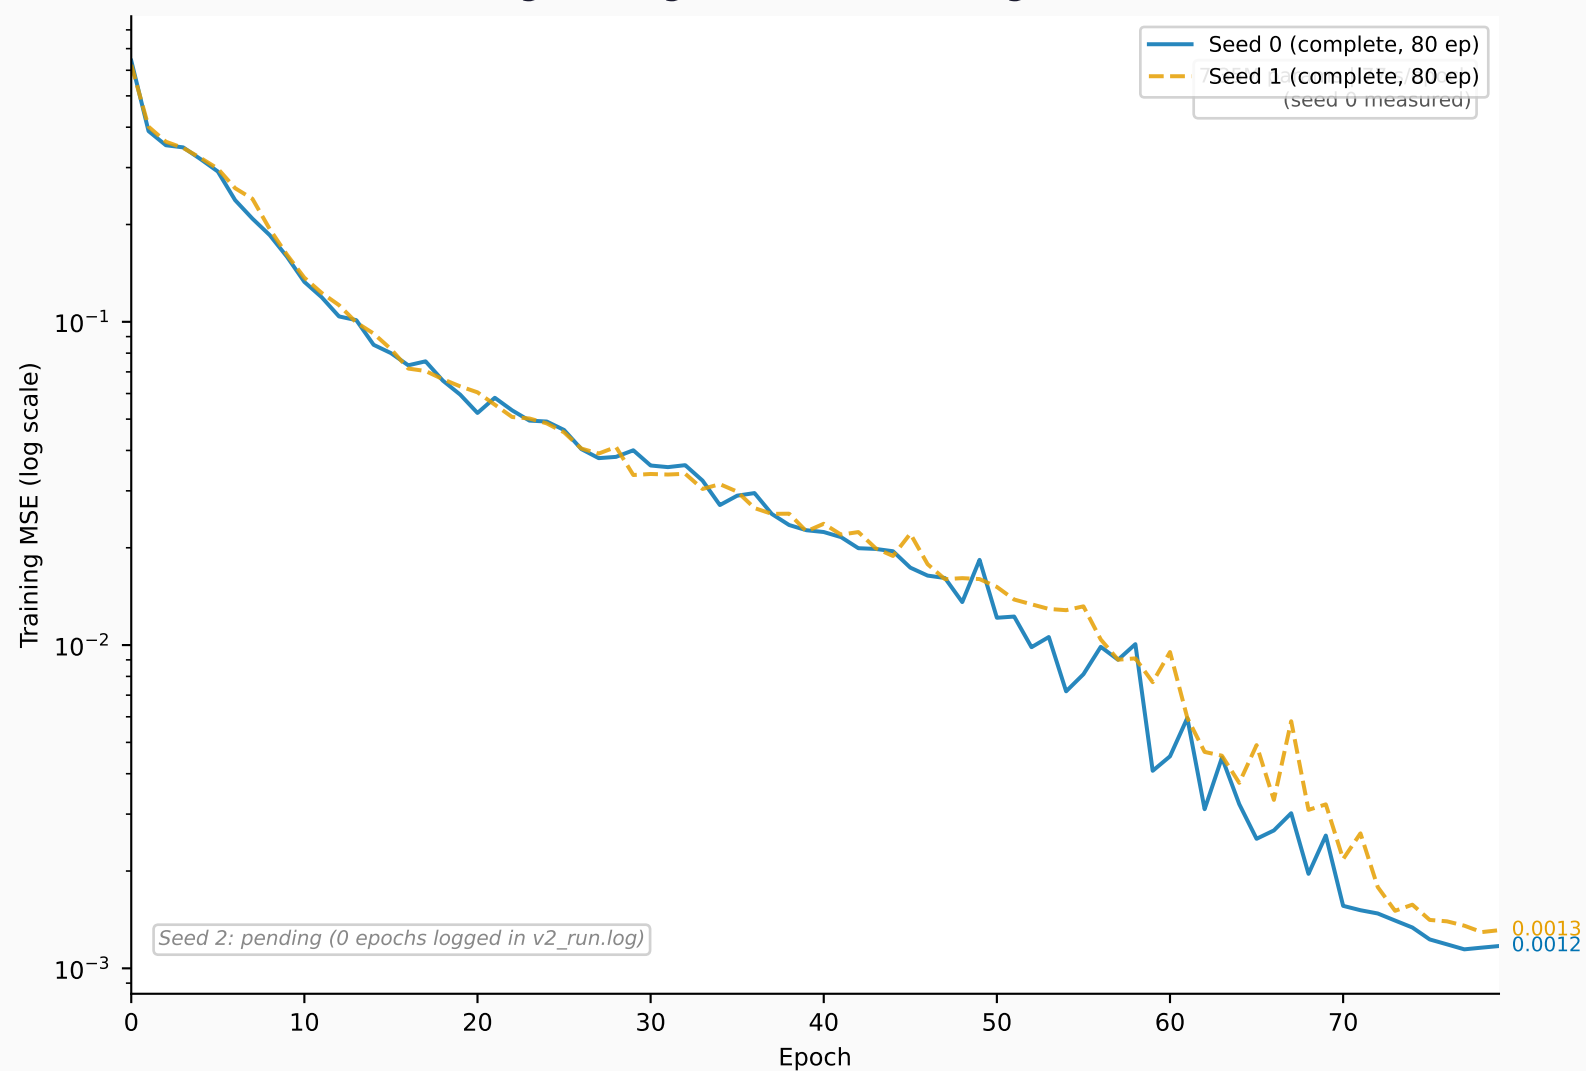

(A) Experimental scope at a glance

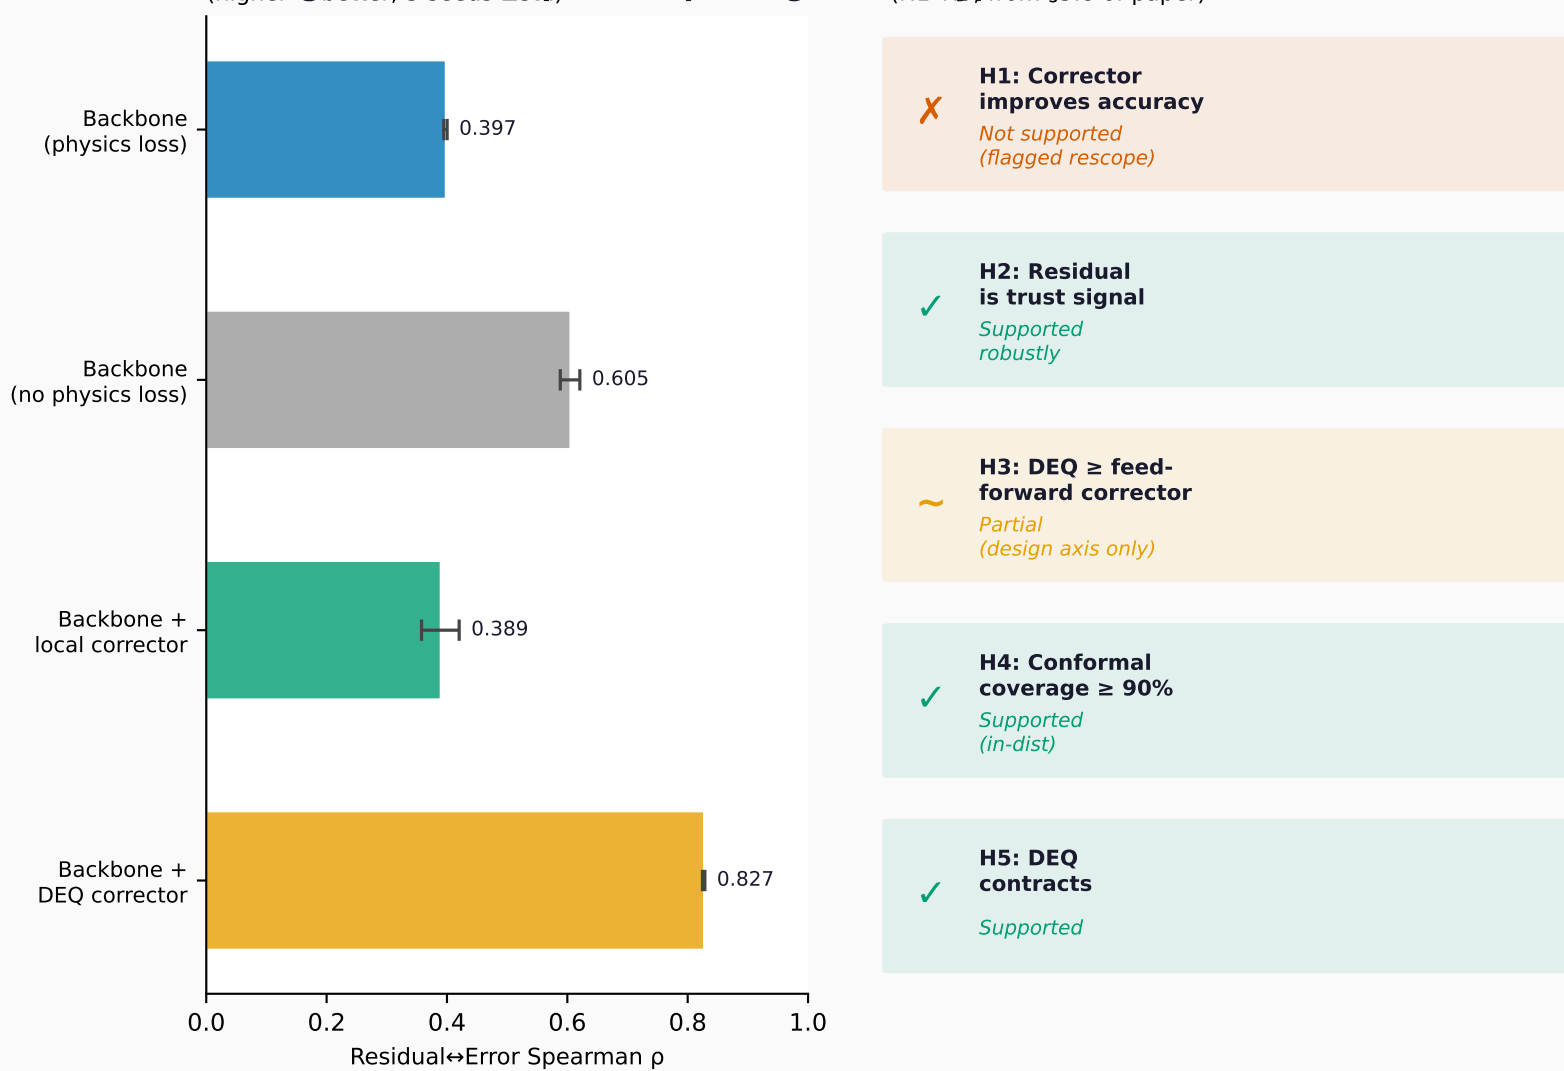

(B) Where the compute went

(C) v2 backbone training convergence (Transolver, log-MSE)

(D) Rigor: ablation spread & pre-registered hypothesis verdicts

All numbers from committed files. Measured (solid): in-dist 5.87h, OOD 10.96h (SUMMARY.md). Estimated (hatched): baseline, certs, sensitivity, v2. Epoch total = in-dist 1080 + OOD 2160 + baseline 240 + v2 300 (planned) = 3,780 total. v2 seed 2 not yet run. Lower MSE better; ρ closer to 1 better.
